Hey, is there a way to make children killable?
Can i do it with a hex edit?

Cheers

yep!

but this method is messy

killable children is hardcoded with AGE parameter

so if you change age for all children's to > 18 then they will be killable and they no more will be children...

so you _probably_ (I never tested!! :D) have sex with them

you may use GDB editor

you need to edit globals.gdb file

the main children offset is: 101BF01F

you need AgeComponent, change Age to > 18 or to 0 (then they will be month-old baby, killable baby)

or use HEX-editor, go to 0019176C offset and change A value to > 12 (hex) or to 0
this offsets for latest DLC

also, this effects only for new children's, not to already exist

Thanks, can you send me the link to the GBD editor? Keshire hasn't uploaded it yet.

Btw, i'm still learning how to hex edit so i am a bit confused. I only have the offset 00191760 not 0019176C does the C represent something?

Thanks.

zyreq wrote on Wed, 19 February 2014 05:52 Btw, i'm still learning how to hex edit so i am a bit confused. I only have the offset 00191760 not 0019176C does the C represent something? 00191760 offset represent line that contains 15 numbers

1 2 3 4 5 6 7 8 9 A B C D E F

so you need: C

smart HEX-editor show selected offset in status bar

also simple use GO TO function

this offsets for latest DLC

also, this effects only for new children's, not to already exist

It's probably used in one of the combat targeting scripts too. So hitting up the GDB would be kind of a workaround.

Thanks.
But i can't manage to open a .gdb file with the editor for some reason.

Also, if i create a new game i assume all the children will be killable, right?

EDIT: Once i finish editing the gdb how do i import it into levels.bnk?

Keshire wrote on Thu, 20 February 2014 01:32It's probably used in one of the combat targeting scripts too. So hitting up the GDB would be kind of a workaround.hmmm, maybe but I think it something more than external script function
I mean, children's, they are like not exist for combat, AI just ignore them, they are completely not hittable, like they are fucking immortal gods...
so I think it something in game engine itself
also, I remember when I experimenting with them, I change some "targetable" component or something and sometime enemy can hit them with area magic cast, but they not die
zyreq wrote on Thu, 20 February 2014 04:28But i can't manage to open a .gdb file with the editor for some reason.editor need to be in the same folder as .gdb file
zyreq wrote on Thu, 20 February 2014 04:28Also, if i create a new game i assume all the children will be killable, right?yes
zyreq wrote on Thu, 20 February 2014 04:28EDIT: Once i finish editing the gdb how do i import it into levels.bnk?levels.bnk?
you are using globals.gdb from original game?
if so, then those offsets is not correct

to import modded files to game use timeslip xlive remover
Keshire already write how to

if he play with Traitor's Keep DLC of course
this the AGE offset for non DLC globals.gdb
001778DC

Thanks again guys.

Okay, i have finished modifying the globals.gbd, now what?
I downloaded the xlive remover and read the readme but mentioned nothing of custom files.

you need to pack it to .bnk and place in subfolder mod1 - mod9 in data folder
use this as example

Can someone help me?
I have one problem with these ways to make children killable.
I don't have a "Globals.GDB" file in my Fable III game. I have, in "Fable III/data/Globals (folder)/
"Globals_models.bnk" and "Globals_textures.bnk". What should i do? I have to open one of those

files to modify the age thing? I can only open the 1st file with Programmer Studio and inside there's nothing like the offset's you are giving here...
Can someone explain me what to do...?

Hi! Can someone please explain me, step-by-step, and with all details, how to make children killable?
What programs to use? How to use them? Which archives i have to modify and how to do it, etc.? I would REALLY appreciate if someone could help me with this... the file Globals.lua doesn't exist in my game directory. There exist 2 files called "globals_textures.bnk" and "globals_models.bnk"...

use BlackDemon's BNK Utils to extract "Globals.GDB" from .bnk file (I don't remember which one, streaming.bnk or levels.bnk)
BUT if you use DLC, extract it from dlc2free.bnk (Traitors Keep) or dlc_freeforall.bnk (Understone) after modifying you need to pack it again
better to separate DLC folder, but you can replace original

SIMPLE WAY is use some mod that modifying "Globals.GDB" like this one
just extract, mod Globals.GDB and pack it back

So I pulled everything out from the Traitor's Keep DLC and found the globals.gdb file. Opening it with the GDB Editor and running Arto's offset through it I found the AgeComponent variable, but it looks like this: B3688653

It says in a HEX conversion table that 19 is written as 13, but I don't quite get how to run that through using the format Fable 3 uses.
Would it be so simple as editing it to read 00000013?

Ah, that's what it was. I forgot to check the "Extrapolate Parent and Child" box.
Thanks again, Arto.

After six years since last discussion I've uploaded to the Nexus a copy anyone can install if they want it. I also have more extensive mods which integrate this (under the radar of course).<https://www.nexusmods.com/fableIII/mods/7?tab=description>
